Resistance (voltage drop) is the enemy! Increased resistance between the battery and the starter causes the starter to turn slower and work harder. Resistance increases in direct relation to the length, and/or the decrease in diameter of a replacement battery cable.

Contel Shipping Division 908-743-1970

To get full battery voltage to the starter during cranking, always use **SHORT** and **FAT** battery cables!

● Use copper strand battery cables; aluminum cables do not carry current as
